#### What did we want to do again?

**Goal:** Given a signed graph G and a nonnegative integer k,

#### What did we want to do again?

**Goal:** Given a signed graph G and a nonnegative integer k, use  $Y_G$  to compute sink<sub>G</sub>(k), the number of acyclic orientations of G with k sinks.

#### What did we want to do again?

**Goal:** Given a signed graph G and a nonnegative integer k, use  $Y_G$  to compute sink<sub>G</sub>(k), the number of acyclic orientations of G with k sinks.

Specifically, we will find a linear map  $\varphi \colon \mathsf{BSym} \to \mathbb{Z}[t]$  such that

$$\varphi(Y_G) = \sum_{k=0}^{\infty} \operatorname{sink}_G(k) t^k.$$

#### What did we want to do again?

**Goal:** Given a signed graph G and a nonnegative integer k, use  $Y_G$  to compute sink<sub>G</sub>(k), the number of acyclic orientations of G with k sinks.

Specifically, we will find a linear map  $\varphi \colon \mathsf{BSym} \to \mathbb{Z}[t]$  such that

$$\varphi(Y_G) = \sum_{k=0}^{\infty} \operatorname{sink}_G(k) t^k.$$

For example, if  $G = \bigcirc$ , then  $\varphi(Y_G) = 1 + 3t$ :

$$S \subseteq \{0, \ldots, n-1\}$$
 and  $\varepsilon \in \{-1, 1\}^n$ , define

$$Q_{S,\varepsilon} := \sum_{\substack{0 \le i_1 \le \dots \le i_n \\ s \in S \implies i_s < i_{s+1} \\ 0 \in S \implies 0 < i_l}} x_{\varepsilon_1 i_1} \cdots x_{\varepsilon_n i_n}.$$

#### Lemma

Let P be a signed poset. Then

$$Y_P = \sum Q_{A(\alpha,\omega),\varepsilon(\alpha)}.$$

 $\alpha$  is a linear extension of P

### Step 3: An awful function

Let 
$$S \subseteq \{0, \ldots, n-1\}$$
 and  $\varepsilon \in \{-1, 1\}^n$ . Then

$$\varphi(Q_{S,\varepsilon}) := \begin{cases} t(t-1)^k & S = \{0, \dots, n-k-1\} \text{ and} \\ \varepsilon_i > 0 \text{ for each } i \in \{n-k, \dots, n\} \\ (t-1)^k & S = \{0, \dots, n-k-1\}, \ \varepsilon_{n-k} < 0, \text{ and} \\ \varepsilon_i > 0 \text{ for each } i \in \{n-k+1, \dots, n\} \\ (t-1)^n & S = \emptyset \text{ and } \varepsilon_i > 0 \text{ for each } i \in \{1, \dots, n\} \\ 0 & \text{otherwise.} \end{cases}$$

#### Step 3: An awful function

Let 
$$S \subseteq \{0, \ldots, n-1\}$$
 and  $\varepsilon \in \{-1, 1\}^n$ . Then

$$\varphi(Q_{S,\varepsilon}) := \begin{cases} t(t-1)^k & S = \{0, \dots, n-k-1\} \text{ and} \\ \varepsilon_i > 0 \text{ for each } i \in \{n-k, \dots, n\} \\ (t-1)^k & S = \{0, \dots, n-k-1\}, \varepsilon_{n-k} < 0, \text{ and} \\ \varepsilon_i > 0 \text{ for each } i \in \{n-k+1, \dots, n\} \\ (t-1)^n & S = \emptyset \text{ and } \varepsilon_i > 0 \text{ for each } i \in \{1, \dots, n\} \\ 0 & \text{otherwise.} \end{cases}$$

**Obnoxious obstruction:** The  $Q_{S,\varepsilon}$ 's aren't linearly independent!

$$Q_{\{0\},-+} - Q_{\{0,1\},-+} = Q_{\{0\},+-} - Q_{\{0,1\},+-}.$$

References

#### The conclusion

Theorem For any signed graph G,

$$\varphi(Y_G) = \sum_{k=0}^{\infty} \operatorname{sink}_G(k) t^k.$$

Proof. We have

$$\varphi(Y_G) = \sum_{\substack{Y \text{ is an acyclic} \\ \text{orientation of } G}} \varphi(Y_P)$$
$$= \sum_{\substack{Y \text{ is an acyclic} \\ \text{orientation of } G}} t^{\text{sink}(P)}$$
